

# Photoshop 7 Scripting Support – Release Notes

Version 1.0.2 fixes the following issues:

- ❖ The Art Layer object's "text item" property has been renamed "text object" to avoid conflicts with the "text item" class that is part of the built in AppleScript terminology. Existing scripts will continue to run without change.
- ❖ The ScriptingSupport plug-in has been updated to work on Windows 98.
- ❖ When an error occurs while executing JavaScript the entire error message is now returned to the user.
- ❖ If a JavaScript or a Visual Basic script held references to layers or channels in multiple open documents then these references could get corrupted.
- ❖ If you tried to install the ScriptingSupport plug-in on a Windows system that did not have Photoshop 7 installed, then the installer would display an error message stating that insufficient disk space was available.

Version 1.0.1 fixes the following issues:

- ❖ The installer would fail if installing on Mac OS X and no classic environment was found.
- ❖ In some cases a script created by the ScriptingListener would fail to execute.
- ❖ Resizing documents did not work if re-sampling was set to none. If you resize without re-sampling you may only specify either `resolution`, `width` or `height`; and height and width may not be specified using pixels. This means that if you are resizing without re-sampling using VisualBasic or JavaScript, you may have to set the `ruler unit` property of the `Preference` object to something other than pixels.
- ❖ Resizing documents did not work if the height or width of the new document was specified using pixels and if the `resize` command also specified a new document resolution.
- ❖ The "AddTimeStamp.js" JavaScript that is installed in the "Scripts" folder used the wrong property to set the location of the text.
- ❖ In AppleScript, when getting a value as a specific unit type a unit-value rather than a number was returned.
- ❖ Adjusting a layer using the `mix channels` adjustment type would fail if an integer value was used in the `output channels` list.
- ❖ The initial color of text has been changed to black.

- ❖ On Mac OS 9 with TCP/IP configured for PPP connection and with Remote Access configured for “automatic connection” the Scripting Support plug-in would initiate a PPP connection when Photoshop was launched.
